

# Shape Cutting Attachments And Templates

Even novices to pipe cutting and beveling can achieve superior-quality craftsmanship in making saddles, Y's, T's, miters and various angle cuts on all H&M machines with shape cutting attachments and templates.

Each custom-made, H&M prefabricated metal template is bolted to the face of the ring gear. The torch is spring-loaded against the template. While the machine rotates around the pipe, the torch moves along the same path as the template. The triangular design of hard-anodized travel tubes and carriage rollers ensures lateral torch stability and smooth, consistent, horizontal torch travel during a complete revolution. Achieve accurate cuts from proven patterns every time, even when cutting miters up to 45 degrees.
